Refurbishment or Replacement Lift and Escalator Consultancy

Cundall's Vertical Transportation team offers a full range of lift and escalator consultancy services. The Cundall team collectively has over 100 years' experience in lift and escalator traffic analysis, design, installation, refurbishment, modernisation, replacement and maintenance covering all types of lifts, escalators and moving walkways.

Refurbishments

Refurbishments can successfully revive aging lift and escalator equipment, extending their lifespan and offer significant savings over complete equipment replacement. With a detailed knowledge of existing equipment and new technologies available, our team can advise how best to extend the life of existing systems. The team will carefully select the components to be replaced which will work in harmony with retained sections.

Our team have extensive experience in all areas of this specialist field from major refurbishment to groups of lifts in prestige high demand environments, to smaller life extending and code-compliance refurbishments completed for local authorities.

Improve Performance

Dated technology often means limited performance and influences. With careful selection and replacement of key components, the performance can be revived and improved without the need for complete equipment replacement.

Extend Life and Enhance Safety

As lift equipment wears, ages and becomes obsolete, the reliability suffers and downtime becomes noticeable. Refurbishment and replacement of only the parts that are worn allows the working life of a lift to be extended by many years.

It is also the opportunity to update the equipment to comply with current legislation and safety best practices, ensuring that the equipment not only performs better, but also reduces potential for litigation due to user accidents.

Complete Replacement

In some cases, complete removal and replacement of the lift may be more cost effective than refurbishment. In addition, this could provide additional benefits such as changing from manual to automatic door arrangement, or to install a machine-room-less lift and re-use the machine room for another purpose.

We can advise on the suitability of your lift for this approach, and any associated considerations.
